# A Method for the Part Extraction of Handwritten Scores

Version 3 - 7 July 2012

David Pocknee (david [at] davidpocknee.com)

This method is designed for the easy extraction of instrumental parts from handwritten scores.
The process works by taking the scanned images of pages of your scores, copying the area containing a particular instrument into new files, and then compiling it into an OpenOffice word file.

In order for this method of part extraction to work successfully, your score must:

- Have the same instrument layout on every page.
- Have a space between each instrument staff.
- The staffs between instruments should not be linked with barlines.

An ideal score layout would be something like this:

## *Programs used:*

This method uses two, free, open source programs, available for both mac and PC. These programs need to be downloaded and installed before any of the steps below can be followed:

- GIMP image editing program
  - Available from www.gimp.org
  - This method definitely works with version 2.6.8.
- OpenOffice
  - Available from www.openoffice.org
  - This method definitely works with version 3.0.0

This process utilises two scripts:

1. A script for GIMP which extracts the parts into separate files.
2. A script for OpenOffice which compiles them.

Before the first time you extract a score, a script for GIMP and a script for OpenOffice must be installed, but this only needs to be done once:

## *To Install The GIMP Script (this only needs to be done once):*

1. Paste the text in ***Appendix I*** into a text editor (e.g. Notepad for Windows or Textedit for Macs) and save it as a .scm file in the GIMP scripts directory (this can be found by opening GIMP and going to: Edit/Preferences and then clicking Folders/scripts).

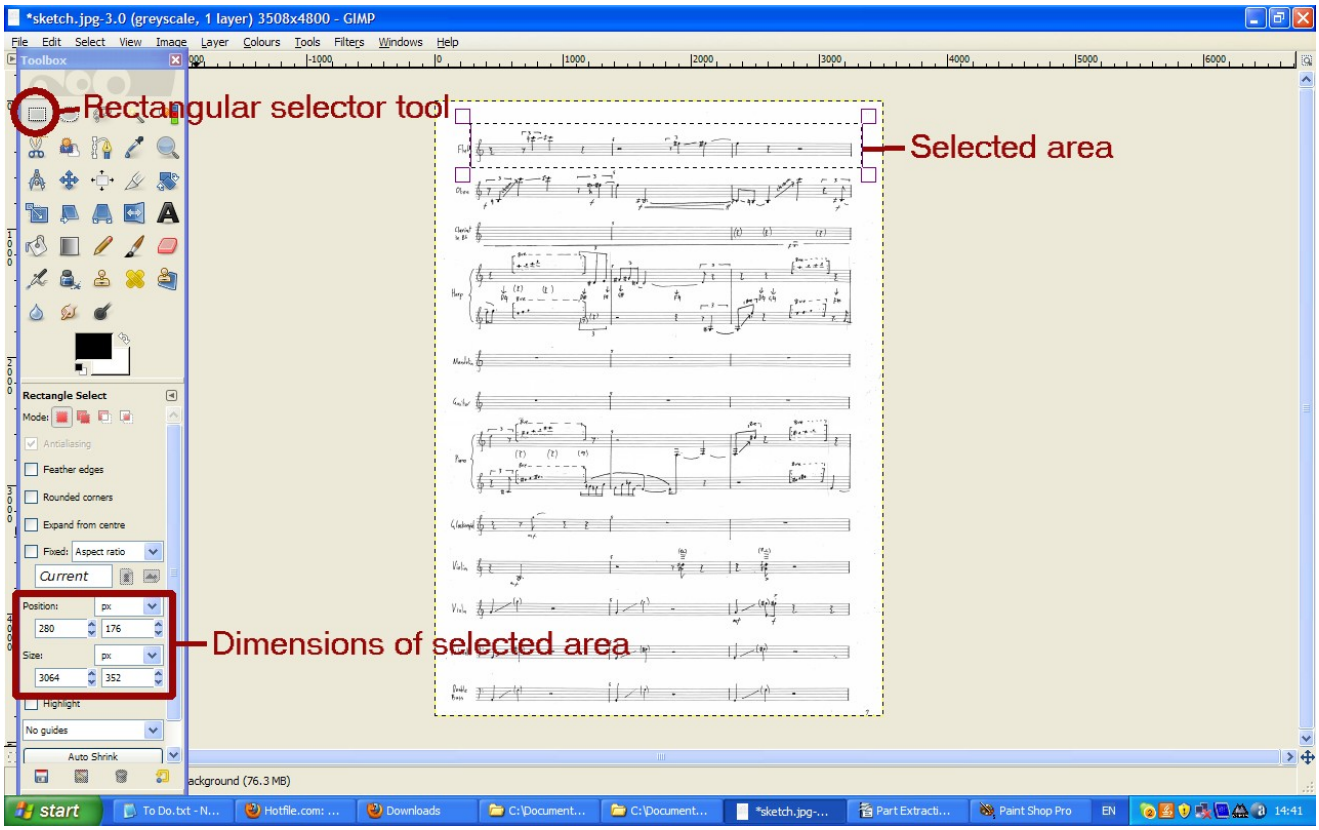
## *To Install the OpenOffice Script (this only needs to be done once)*

1. Open up OpenOffice's 'Writer' application, start a new document and go to: Tools/Macros/Organize Dialogs...
2. Click on the 'Modules' Tab.
3. Click on the 'My Macros' icon in the left hand pane.
4. Click on the 'New...' button.
5. Enter the name 'Extractor' into the box that appears.
6. Click on the 'Edit' button.
7. A text window will open. Delete any code that is there and paste in all the code from ***Appendix II***.
8. Go to File/Save.
9. Close the window.

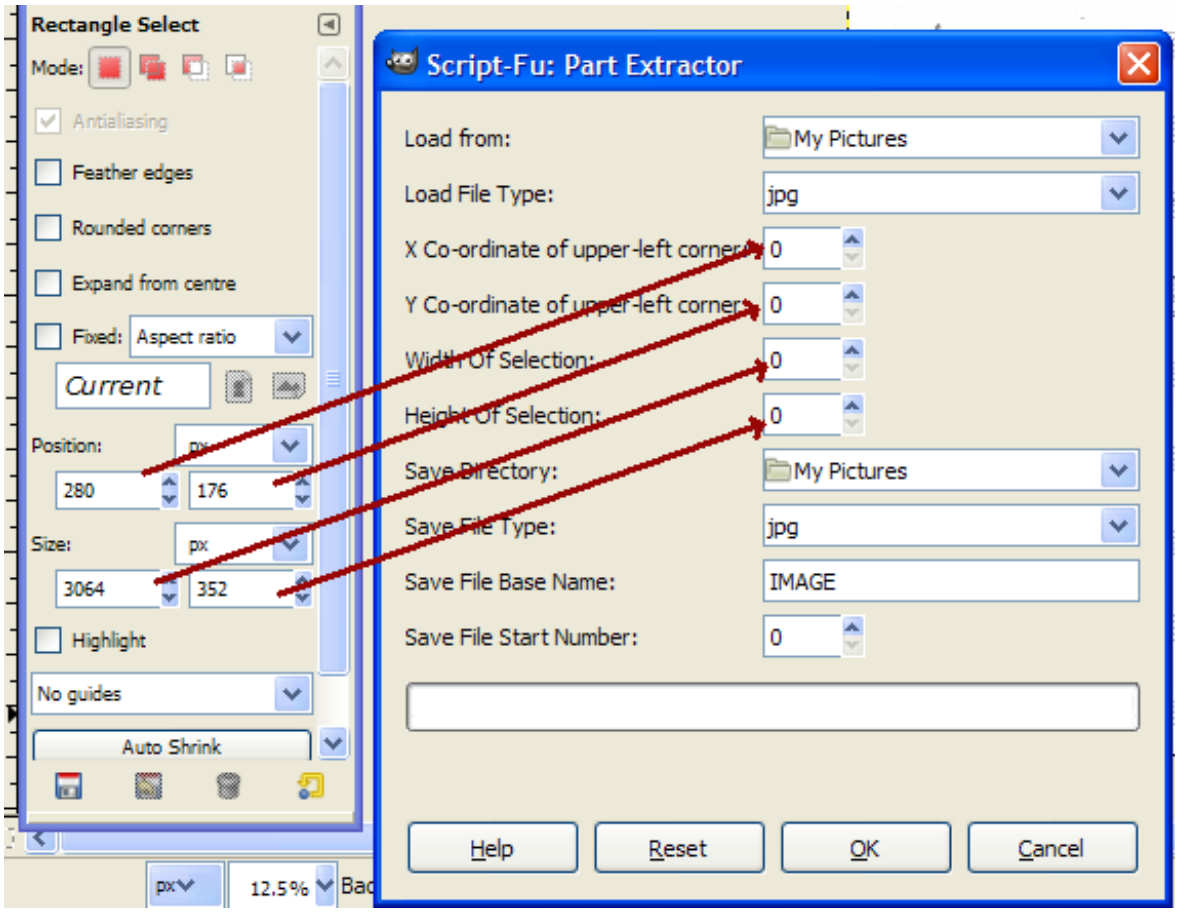
# Extracting Parts with GIMP:

Once the scripts for GIMP and OpenOffice have been installed, you can follow the steps below:

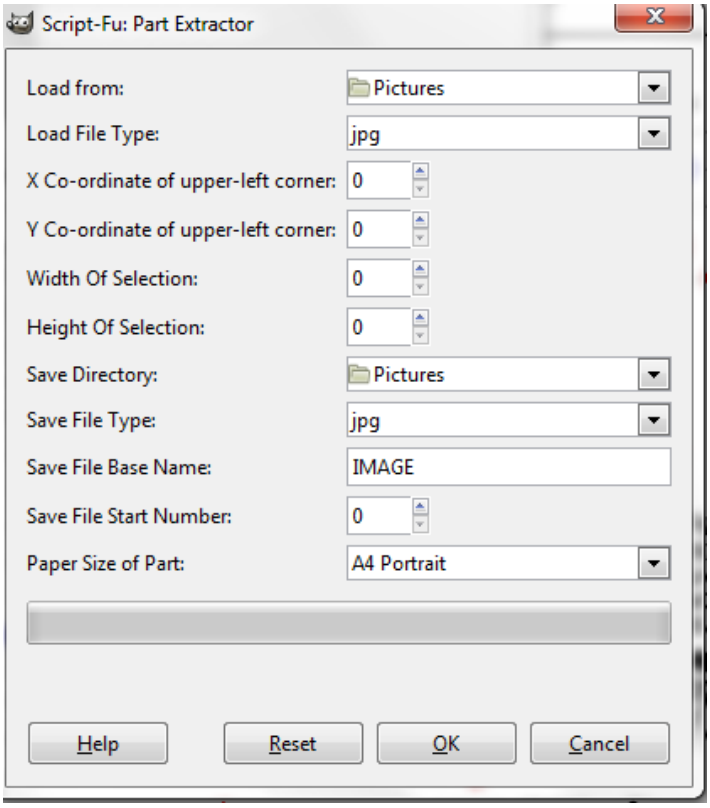
1. Scan in all pages of your score and save them as .jpg .png, .or .bmp.
2. Place all the files in the same folder and number the files as 'page01', 'page02' etc.
3. Load up GIMP, click File/Open and find a page of your score.
4. Use the Rectangular selector tool to highlight the area containing the staff of the instrument you want to extract.
5. Make a note of the dimensions of the rectangular area you selected. These are displayed in the box at the bottom left of the window (highlighted below).



6. Go to File/Part Extractor... and copy the values for the rectangular box into the boxes of the Part Extractor window, shown below. (If 'Part Extractor...' does not show up in the File menu, it means you have not installed the GIMP script correctly):



## Guide to the options:



- The directory your score pages are in.
- The file type of the score pages.

- The directory you want the parts saved in.
- The file type you want the parts saved as.

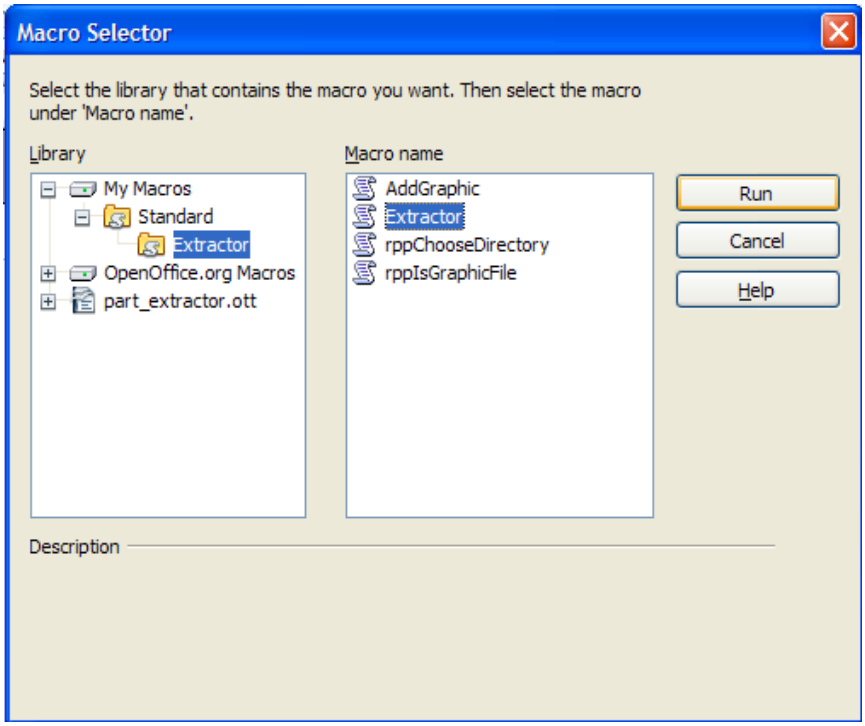
- The filenames you want the parts saved as. Here I have used 'Flute' as this is the flute part.
- The paper size and orientation of the paper the part will be placed on. The program will automatically scale the width of the staff to the width of the paper size.

**NOTE: You need to use a separate folder for every instrument you extract as the OpenOffice macro compiles all files in a selected folder into one part.**

8. Click OK and the program will extract the area of your rectangular selection from every file in your selected folder to the output folder you have selected.

# Compiling Parts In OpenOffice:

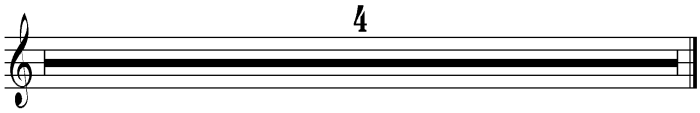
18. Go back to your new text document and go to:
    Tools/Macros/Run Macro...
19. Click on the + symbol next to the 'My Macros' icon in the left pane to expand the folder and then click on the + symbol next to the 'Standard' icon that appears beneath it.
20. Click on the 'Extractor' folder that appears below it.
21. Click on the 'Extractor' symbol in the right pane.
22. Click on the 'Run' button.



24. A dialog box will appear. Select the folder in which you extracted your files to with the previous script and click OK. Every file in the folder will be compiled into your document.

## Things to consider:

If a part needs a multirest symbol, such as the one below, then this will need to be drawn separately, scanned in, and added by hand:



Any comments, suggestions or improvements can be directed to david [at] davidpocknee.com

# Appendix I

Paste this into a text editor and save it as a .scm file in the GIMP script directory which can be found by opening GIMP and going to: Edit/Preferences and then clicking Folders/scripts
